Resumen. Hasta donde sabemos, el tono del receptor 5-HT₆ serotoninérgico intrahipocampal en los modelos de memoria y amnesia sigue sin ser explorado. Por tanto, en el presente trabajo probamos la administración intrahipocampal de serotonina o de moléculas experimentales del receptor 5-hidroxitriptamina (5-HT₆) con actividad diferencial intrínseca.

Abstract. To our knowledge, the intrahippocampal serotonergic 5-HT₆ receptor tone in memory and amnesia models remains unexplored. Hence, in the present work we tested the intrahippocampal administration of serotonin or experimental molecules of the 5-hydroxytryptamine (5-HT)₆ receptor with intrinsic differential activity.
